

Documentary credit on Creditcoin

BUIDL CTC 2026 Fall · RWA track · Built on the Attestcoin Protocol

- THE PROBLEM

Trade finance still runs on paper and trust

- A documentary credit is how most of world trade gets paid for: an importer's bank promises to pay once the exporter proves, on paper, that goods shipped.
- Two banks manually check paper documents against the credit terms.
- The process routinely takes days to weeks, and costs real fees on both sides.
- It depends entirely on trusting both banks to do their job honestly.

- THE IDEA

Replace the manual check with a proof

- An importer's payment sits in escrow on Creditcoin, not in a bank.
- The exporter presents proof of shipment on another chain, a real, public transaction.
- The Attestcoin Protocol proves that presentation happened, cryptographically.
- Aval's contract verifies the proof and releases the escrow itself. No bank. No oracle. No bridge operator in the loop.

Four steps, start to finish

1**Issue**

The exporter sets the terms: amount, importer, beneficiary, and the document hash required.

2**Fund**

The importer locks the amount in escrow, on-chain, on Creditcoin.

3**Present**

The beneficiary presents the document on the source chain, a real transaction.

4**Honor**

Attestcoin proves it happened. Aval checks the hash and releases escrow automatically.

- DEPTH OF INTEGRATION

A real Attestcoin integration, not a token wrapper

- Built on Gluwa's own ASCBase and EvmV1Decoder, the same base contracts their audited loan example uses.
- Every payout traces back to a real inclusion and continuity proof, verified against the live block prover precompile on Creditcoin CC3 testnet.
- Full lifecycle usage, issue, fund, present, prove, honor, not a single decorative proof call bolted onto a lending clone.
- A public proof explorer shows the decoded event behind every payout, for anyone to check.

- INSTRUMENT FINANCING

RWA meets DeFi, without stretching either

- A funded instrument is a confirmed, escrowed receivable.
- The beneficiary can borrow 80% of it immediately from AvalCollateralVault, instead of waiting out the full presentment window.
- The loan repays itself automatically, straight out of the payout, the instant the instrument is honored.
- The borrower never touches the money until the loan is already settled, there is no separate repayment step to skip.

• STATUS

Live right now, not a demo network

Contracts

Deployed and verified on Creditcoin CC3 testnet and Sepolia

Settlement

Both native CTC and an ERC20 stablecoin, live and tested

Full lifecycle

Run for real, multiple times, with two separate wallets

Frontend

Live at aval-three-phi.vercel.app, desk, issue, fund, present, verify, lend

- TEAM & ROADMAP

Built solo. Built to grow.

TEAM

Uzoechi Raphael · github.com/angelraph/aval

ROADMAP

- Support more source chains beyond Sepolia.
- Extend AvalCollateralVault to ERC20-settled instruments.
- Move from a single demo lending pool to a real receivables market.

Trade finance is a multi-trillion-dollar market.

Aval is what it looks like without the paperwork.

Asking for CEIP fast-track access to take this further.
